

ANINDYA SUNDAR NANDI

Master's Student in Computer Science

📞 (+91) 6296689986 ✉ anindyanandi.work@gmail.com 🔗 [LinkedIn](#) 🔗 [GitHub](#)

SUMMARY

Software Engineer with strong foundations in Computer Science and Mathematics, experienced in building backend systems, APIs, and data-driven applications. Proficient in Python and JavaScript with hands-on experience developing RESTful services using FastAPI and Django, and building interactive frontends with React. Skilled in designing scalable application logic, automating workflows, and integrating third-party APIs. Passionate about writing clean, efficient code and solving real-world engineering problems.

EDUCATION

Master of Science in Computer Science (M.Sc.)

Vidyasagar University

📅 09/2023 - 07/2025 📍 Medinipur, India

Bachelor of Science (Honors)- Mathematics

Vivekandanda Satavarshiki Mahavidyalaya

📅 07/2019 - 08/2022 📍 Manikpara, India

SKILLS

Python	JavaScript	React.JS	FastAPI	HTML	CSS	SQL	Django	Streamlit	Git
GitHub	Docker	Pandas	Scikit-learn	NumPy					

PROJECTS

YouTube Chatbot

- YouTube Chatbot project to interact with video using available video transcripts
- Engineered an interactive chatbot using LangChain and OpenAI APIs to generate context-aware responses from YouTube video transcripts
 - Implemented transcript extraction and translation using YouTube-transcript-API and deep-translator, enabling multi-language support
 - Developed a Streamlit web interface for seamless real-time user interaction

Plant Leaf Disease Recognition

- Plant Leaf Disease Recognition using DL techiness with the help of transfer learning
- Developed a deep learning-based crop disease classification system using transfer learning with EfficientNet-B4 achieving 98.17% accuracy
 - Employed Python, PyTorch, and machine learning techniques for model development, evaluation, and visualization
 - Conducted performance comparison and analysis of different pre-trained models to select the best-performing architecture for each crop type

AI Web Scrapers

- AI Web Scrapers project for scraping website data
- Built a web scraper using Python, Selenium, and BeautifulSoup to collect data from dynamic web sources
 - Integrated LangChain to automate LLM-driven data parsing, summarization, and custom analysis based on user-defined prompts
 - Enabled dynamic, command-based interactions where the LLM analyzed and processed scraped data according to real-time instructions
 - Automated multi-stage workflows combining data extraction, cleaning, storage, and intelligent analysis
